CTF2 Field Card

Rosetta Fragments — the four moves, pocket-sized

Pocket-sized. The schema, the codes and the doctrine live in the **Ledger Reference** — keep that open too.

The shape of this hunt

A crew split one payload across four packages. Each package was under-declared to stay beneath the wire, written in a different tongue, and shaped a different way — because a filter tuned for one evasion catches only that evasion. Individually unremarkable. Together, one campaign.

> **One detail gives them away:** every package carries the same forged inspection stamp.

Before you start: the pieces do not arrive wrapped. You assemble them and add the `flag{ }` wrapper yourself — the final step is spelled out on the back of this card.

The four moves

1 · Split and compare across languages

`Patterns` packs several stamps into one string, so split **before** you count, or you are counting combinations rather than marks. Drop the leaderboard traffic first — live submissions land in this table too, and they will move the counts under you.

```
PolyglotPoisoning_CL
| where UserPrincipal !endswith "@lb"
| mv-expand stamp = split(Patterns, ",") to typeof(string)
| summarize packages = dcount(UserPrincipal), langs = dcount(Language)
          by stamp
| sort by packages asc
```

Rare is a shortlist, not a verdict. The one worth a look is the stamp keeping company with more languages than its size explains.

2 · Filtering — cut to the carriers

```
PolyglotPoisoning_CL
| where Patterns contains "..."
```

3 · Sequencing — order reveals structure

```
PolyglotPoisoning_CL
| order by SomeColumn asc
```

4 · Extracting — pull fenced text out of prose

```
| extend piece = extract(@"<fence>(...)<fence>", 1, SomeColumn)
```

The fence is a pair of characters ordinary prose would never use.

Remember

- A score under 5 passes the wire. **Under-declared cargo is the oldest trick in the supply chain.**
- Contraband rarely ships in one box. Split payloads reassemble.

- The same stamp on many packages is either a trusted shipper — or one forger. **Rare is not the same as forged.**
- One crew that changes language *and* shaping on every package is betting you file four small incidents instead of one big one.
- **Trust the declared values, not the clock.** Not everything worth finding wears a wrapper.

> **Final step — do not miss this.** Assemble the fragments in the order the declared values give you, then add the `flag{ }` wrapper **yourself**. The pieces do not arrive wrapped.

Rehearse every move offline first against `data/practice_ledger.jsonl` — same seven columns, no lab needed.
